Github setup

1) Check your inbox for the github inviation email.
2) If it's there:
   a. Create a github account. Go to github.com and follow the steps.
   b. Use the email adress where you found the invitation. This is crucial. If you want to use a throwaway email account, I can send a new invitation but I need to know the email.
   c. Once you have your account, accept the invitation by clicking the link in the invitation email. If you log into github via browser, the git page should show up in the sidebar.
3) Download the github client and install it on your system.
4) Log in on your github client with your account. The git repository should be visible as an option in the current repository tab.
5) Select Game Theory Project as your current repository. In the upper middle, there is a button called fetch origin. Press it to update your local copy of the repository. You can check if the data has been added to your hard disk by opening the current repository tab, right click and select "show in Explorer".

Working with github:

Any files you create need to either have a copy in the github directory on your hard disk or, preferably, you create them directly in that folder. Github features integration for many software depevelopment environments, but I havn't used that so far for my projects.
